

Thank you for your interest and for taking the time to speak with us. As part of our evaluation process, we have an assessment task for you. This task is mainly to understand how you approach requirements, structure the solution, and demonstrate your analysis and thinking skills.

Task: ESG Materiality Survey & Visualization Feature

Goal:

Build a feature using **Node.js (backend)** and **Vue.js (frontend)** that enables organizations to collect ESG ratings from multiple stakeholder groups, analyze the data using AI, and generate materiality visualizations and a summary report.

Example Scenario:

An admin defines several stakeholder groups (e.g., employees, management, customers, community, investors) and assigns them a materiality survey. Each stakeholder group completes the survey by rating ESG KPIs. Once all responses are submitted, the system automatically analyzes the results, generates graphs, and produces a short report.

The system should:

- Allow the admin to define and manage 4–5 stakeholder groups
- Provide a materiality survey form per stakeholder group
- Use 8–12 ESG KPIs (e.g., data privacy, cybersecurity, energy use, GHG emissions, etc.)
- Allow stakeholders to rate each KPI using a 1–10 scale

AI Processing:

The system should use AI to:

- Read and process stakeholder responses
- Classify and map responses to ESG KPIs
- Aggregate results for internal vs external stakeholder analysis

Outputs & Visualization:

The system should automatically generate:

- Internal vs External Materiality Graph (KPI importance comparison)
- Stakeholder vs KPI Graph (e.g., employee vs KPI importance)
